**IC6 THERAPY OPTIONS FOR UNILATERAL RECURRENT LARYNGEAL NERVE PARALYSIS
– WHEN AND HOW TO INTERVENE?**

Mueller A. H.

SRH Wald-Klinikum Gera, Dept. ORL HNS, Germany

The course offers a step-by-step introduction to the diagnosis of vocal cord paralysis, from laryngoscopy to laryngeal EMG.

Depending on the stage of unilateral vocal fold paralysis, the patient's needs, and the severity of clinical symptoms, the possibilities of temporary augmentation, type I thyroplasty, and non-selective reinnervation with the Ansa cervicalis nerve are discussed. Case studies will be used to demonstrate the procedures. The treatment results of the different methods will be presented along with our study results and an overview of international literature.

Both beginners and advanced participants are welcome.
